TITLE : Stability of the "Salmonella" Type Bacteria
With Respect to Heating and to Sodium Chloride
ORIG. PUB. : Elem. inar, 1957, 11, No 11-12, 225-231
ABSTRACT : Presented are results of the experiments on
the study of the effect of cooking methods,
boiling and salting, employed in the Hungarian
meat industry on the activity of salmonella
type bacteria. It is established that in the
boiled sausage products, with the improved
techniques in boiling, followed by frying, the
salmonellas are practically absent. Salting
and marinating of products infected with sal-
monella, guarantees their non-toxicity under
the conditions of prolonged curing. It is

"The Effect of Vitamin E on Hemoglobin Synthesis Under Low Protein Nutri-
tional Conditions."

Budapest, A Magyar Tudomanyos Akademia V. Orvosi Tudomanyok Osztalyanak
Kozlemenyei, Vol XVI, No 4, 1965, pages 297-309.

Abstract: [Authors' Hungarian summary] Protein deficiency anemia was de-
veloped in white, male Wistar rats by using a diet which contained only
half of the optimal protein amount, 18 per cent. The hemoglobin of the
animals which were on this diet was considerably decreased with an average
value of 3.4 g per cent. The experimental animals kept on the same diet
which also received oral doses of 40-60 mg dl-a-tocopherol daily were able
to maintain a normal level of Hb with an average value of 13.1 g per cent.
The effect of regular daily doses of vitamin E on the Hb synthesis of
animals on a low protein diet was a pronounced one since it completely in-
hibited the decrease in Hb content in response to the lack of protein. It
is thought that a disturbance in the synthesis of globin, the prosthetic
group of Hb, was caused by the deficiency of vitamin E.

tration. The details of the mechanism of this action of vitamin E have not yet been elucidated; the cause should, presumably, be sought in the effect of tocopherol on the regulation of protein metabolism. 4 Hungarian, 25 Western references. [Manuscript received 20 Jan 64.]

TITLE: The Automation of the Operation of Revolving Drum
Water Strainers

PERIODICAL: Energetik, 1959, Nr 9, pp 14-15 (USSR)

ABSTRACT: The authors describe an automatic device which controls the rotation and cleaning of the drum-type water strainers at the shore pumping station of their GRES. In 1956, the shore pumping station of the GRES had been automated and the operating personnel was withdrawn. Revolving, drum-type water strainers of types T-2000 and RMTs-14500 were installed in front of the pump intakes, since the river contained large quantities of leaves and water plants. These strainers must be rotated periodically and washed with water. The rotating and washing mechanism was to be actuated by a difference in the water level before and

Card 1/3

SOV/91-59-9-7/33

The Automation of the Operation of Revolving Drum Water Strainers

behind the strainers. During 2.5 years of operation it was established that this difference was not adequate for actuating the cleaning mechanism. A level difference was observed only when there was a considerable amount of dirt in the river. Therefore, the cleaning mechanism was controlled by personnel operating the turbines. Although no additional personnel was required, the operation of the water strainers imposed a considerable load on the personnel operating the turbines, especially during floods. The device suggested by the authors consists of intermediate relays EP-103A and time relay EV-133 and the modernized electric clock of type EVChS. The modernizations performed at this clock are shown in Figure 1. The functioning of the relays is described briefly. The time intervals at which the strainers are to be rotated and cleaned are set at the electric clock. During ten months, the operation of this automatic control proved its reliability and flexibility. A circuit

TITLE: The Differential Balancing of AC Bridges (Razdel'noye
uravnoveshivaniye mostov peremennogo toka)
PERIODICAL: Izmeritel'naya tekhnika, 1958, Nr 4, PP 51-54 (USSR)
ABSTRACT: The article demonstrates the practicability of carrying
out differential balancing of ac bridges with zero, in-
stead of differential, indicators connected to the bridge's
diagonal. This can be achieved by connecting the balanc-
ing elements to the bridge so as to keep the current in the
respective branch of the bridge constant during regulation.
The proposed connection scheme makes it possible to all
but eliminate mutual coupling between the balancing cir-
cuits. There are 6 diagrams and 3 Soviet references.

TITLE:

An Alternating-Current Bridge With Automatic Balancing by Two Parameters (Ob odnom tipe mostov peremennogo toka s avtomaticheskim uravnoveshivaniyem dvumya parametrami)

PERIODICAL:

Avtomatika i Telemekhanika, 1958, Vol. 19, Nr 2, pp. 162-173 (USSR)

ABSTRACT:

The stability of a type of automatic bridge circuit, namely that of a four-armed bridge with two servodrives being equal according to their characteristics is investigated. The balancing of the bridge is carried out by resistances installed in one of the arms. For the analysis of such circuits the method of complex coordinates developed by A. A. Krasovskiy (Reference 7) in his work can be used. The effect of the interconnection of the circuits and the non-linearity of static characteristics of the bridge circuit on the stability of the system is explained. A diagram of a bridge circuit is shown where a decoupling of the balancing circuits within a wide range of the measured quantities is possible. In the first chapter the

Card 1/4

An Alternating-Current Bridge With Automatic Balancing by Two Parameters 103-2-5/9

stability of the linearized system is investigated. An equivalent structural circuit of an automatic bridge, built according to the here deduced equations (4a) and (5) is given. From this is seen that this bridge is a two-channel servosystem with antisymmetric rigid couplings with regard to the given effects as well as to the control actions. The characteristic feature of the system is the possibility of changing the coupling coefficient at the expense of the selection of the phases of supply voltages. The effect of the quantities of the coupling coefficient on the properties of the system is shown. An increase of the coupling coefficient leads to a decrease of the critical amplification coefficient of the open system K_{open} , critical, while it is necessary to maintain the given sensitivity and the fast operation of the bridge to maintain the earlier value of the quantity K_{open} . From this immediately follows the demand for a decoupling of the balancing circuits in the automatic bridge. As long as the bridge measuring circuit has non-linear statistical characteristics a decoupling of the balancing circuits (with small deviations) at the expense of a corresponding selection

Card 2/4

103-2-5/9

An Alternating-Current Bridge With Automatic Balancing by Two Parameters

of the phase of the supply voltages can be realized only at one point of the measuring range. The author, however, also points out a possibility of building up a bridge with a phase-dependent zero indicator and balancing circuits operating automatically within the whole measuring range; the bridge balancing elements are connected according to diagram 4 (Reference 8), i.e. in such a way that the current in the arm remains unchanged in the balancing of the bridge. - In the second chapter the stability of the system is investigated taking into account the non-linearity of the static characteristics of the bridge. Condition (26) is derived. This is the necessary and sufficient condition for the stability "on the large" for the type of automatic bridge investigated here. (26) agrees with the stability condition of a linearized system. From this follows that the non-linearity of the characteristics in the case investigated here does not impair the stability of the system. In an enclosure the possibility of neglecting the transition processes taking place within the bridge circuit is shown. There are 7 figures, and 13 references, 10 of which are Slavic.

TEXT: A description is given of bridges and compensators
with servo balancing systems as automatic recording instruments
which are used in the control of production processes and in labora-
tory measurements. The convergence of the auto-balancing process
is analyzed. An investigation is made into the effect of interac-
tion between the balancing circuits on the dynamic properties of
the bridges and AC compensators. Two models have been assembled
of AC bridges with auto-balancing in two parameters, and have con-
firmed the results of the theoretical investigations. 14 figures.

TITLE:

The Convergence of an Automatic Balancing Process of Measuring Circuits With Two Balancing Organs (Skhodimost' protsessa avtomaticheskogo uravnoveshivaniya izmeritel'nykh skhem s dvumya uravnoveshivayushimi organami)

PERIODICAL:

Izmeritel'naya tekhnika, 1959, Nr 3, pp 27-31 (USSR)

ABSTRACT:

Although the first bridges with automatic balancing were built 20 years ago, there are no publications available for projecting such bridges and there are even no clear conceptions of the automatic balancing process. For this reason the author investigated the speed of automatic balancing and the oscillations of the balancing organs for the case of a measuring circuit with automatic balancing by two parameters. He explains the general conceptions of the convergence during the automatic balancing process, the convergence of measuring circuits with linear static characteristics and the equations for servo drives.

Card 1/2

SOV/115-59-3-15/29

**The Convergence of an Automatic Balancing Process of Measuring
Circuits With Two Balancing Organs**

For automatic balancing, the conceptions applied during the manual operation lose their meaning, with the exception of two questions for which the convergence conceptions are used also for the manual balancing process. These are: 1) will the circuit arrive at a balanced state and 2) how does the balancing process proceed. For establishing whether a balancing process is convergent or not, for the system under consideration it is sufficient to check, whether the condition $\cos(\varphi - \psi) > 0$ has been met. For investigating the quality of the balancing process, it is necessary to construct a phase diagram as shown by figure 5. There are 5 diagrams, and 8 references, 5 of which are Soviet, 1 German and 2 English.

TITLE: New way of balancing A-C bridge circuits

SOURCE: Izmeritel'naya tekhnika, no. 2, 1965, 42-43

TOPIC TAGS: electric measuring instrument, electronic circuit, metrology, electronic measurement

ABSTRACT: The method proposed to balance a-c bridge circuits has advantages over the three normally-used methods. The new method requires two adjustments and no phase-shifting elements. If capacitance C_1 and R_1 (see enclosure 1) are to be measured, the equilibrium equations are $R_1 = R_2 (R_3/R_4)$ and $C_1 = C_4 (R_3/R_2)$. In the first adjustment the standard capacitor C_4 is shorted by switch K. The potential point corresponding to apex d of the bridge (see the topographic diagram, enclosure 2) lies on the line ab, at point d', and the phases of the voltage drops on the lower arms of the bridge coincide.

The phase meter across the diagonal has a high input impedance and its reference voltage is the voltage drop across R_2 . Adjusting R_1 , R_3 or R_4 , the meter is nulled when point d reaches d" (the resistance equation is satisfied).

Card 1/2

UDC: 621.317.733.025

L 8913-66

ACC NR: AF6001528

Key K is opened and C_4 is thus returned to the circuit. The potential point corresponding to point d falls on some point d'" on the equilibrium circle shown. Varying C_4 , point d shifts along the circle to c', at which point the bridge is completely balanced. The instant d reaches c can be determined by an amplitude meter connected across the diagonal, but the phase meter can be used instead by closing switch //, whereby the bridge voltage serves as the reference voltage for the meter. Thus the meter serves as a null meter and moreover indicates the direction of imbalance.

A generalized application of the method is given and it is pointed out that the principle involved can be automated. [JPRS]
